Are You Conducting a Complete Brake Job?

Use Our Calculator to Find Out.

Brake system issues are a leading cause of out-of-service violations. When performing brake maintenance, it is important to inspect and maintain the entire braking system to prevent these violations. The goal is not to have more brake jobs, but rather for brake jobs to be more complete, resulting in more uptime.

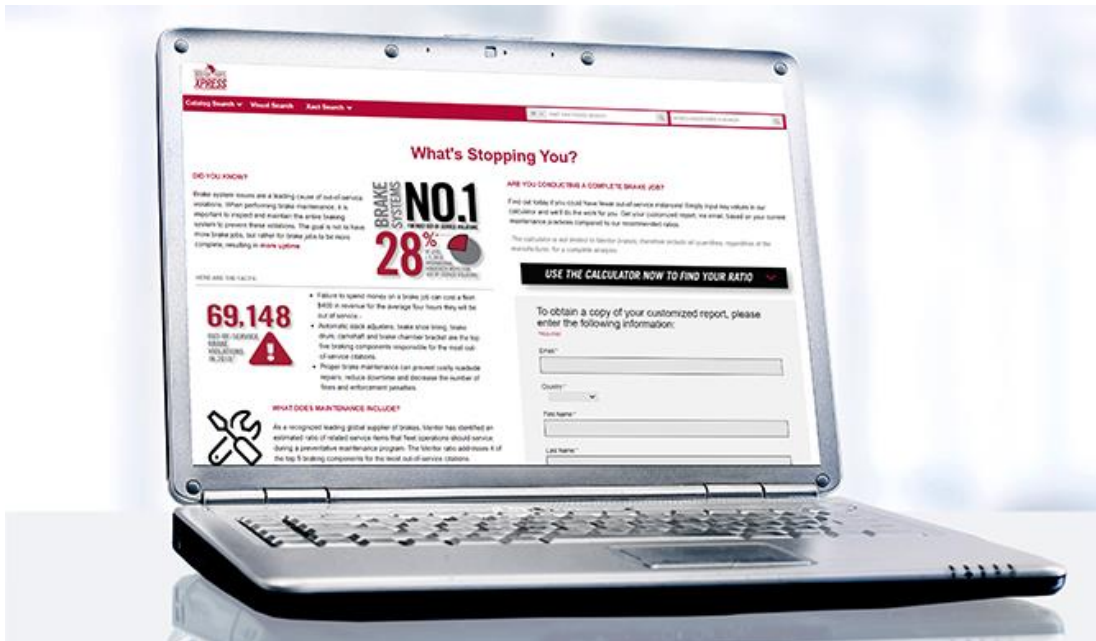

So, what related brake components should be inspected during a service?

As a recognized leading global supplier of brakes, Meritor has identified an estimated

ratio of related service items that fleet operations should service during a preventative maintenance program. The Meritor ratio addresses 4 of the top 5 braking components for the most out-of-service citations. This includes brake shoes, camshafts, camshaft repair kits and slack adjusters.

Want to find out if you are conducting a complete brake job? Use the interactive calculator on MeritorPartsXpress.com to determine if your ratio is HIGHER or LOWER and if you could make adjustments to your preventative maintenance practices.

Simply input the key values in the fields and the calculator will do the rest of the work for you. You will even receive a customized report via email.

MeritorPartsXpress is the right stop to keep your business going and in addition to the calculator tool, offers a variety of easily accessible product resources for air brakes. Check out the [Air Brake Xpress Facts](#) to learn more and [#BrakeWithTheBull!](#)
